

02_orders

Table Purpose

This table captures the complete customer order journey within the e-commerce platform. It contains information related to order placement, approval, shipping, delivery, and estimated delivery timelines.

What One Row Represents

One row represents one unique customer order placed on the platform.

Possible Primary Key

order_id

Reason : Each order appears to have a unique identifier representing a single transaction/order journey.

Possible Foreign Keys

Column	Connected Table
customer_id	customers

Columns Overview

Column	Business Meaning
order_id	Unique identifier for each order
customer_id	Customer who placed the order
order_status	Current status of the order
order_purchase_timestamp	Date and time when order was placed
order_approved_at	Date and time when order was approved
order_delivered_carrier_date	Date when order was handed to carrier
order_delivered_customer_date	Date when customer received the order
order_estimated_delivery_date	Expected delivery date for the customer

Initial Observations

- The table tracks the complete lifecycle of customer orders.
- Multiple timestamp columns can help analyze delivery performance and operational efficiency.
- Order status may help identify cancellations, delays, or successful deliveries.
- The table will likely play a central role in customer retention and operational analysis.
