

03_order_items

Table Purpose

This table contains detailed information about the individual products included in each customer order. It connects orders, products, and sellers while also capturing pricing and shipping-related information.

What One Row Represents

One row represents one specific product item within a customer order.

Possible Primary Key

Composite Key: (order_id + order_item_id)

Reason: A single order can contain multiple products/items.

Possible Foreign Keys

Column	Connected Table
order_id	orders
product_id	products
seller_id	sellers

Columns Overview

Column	Business Meaning
order_id	Order associated with the item
order_item_id	Sequence/identifier of item within the order
product_id	Product being purchased
seller_id	Seller fulfilling the order
shipping_limit_date	Deadline for shipping/processing the item
price	Price of the product item
freight_value	Shipping cost associated with the item

Initial Observations

- One order can contain multiple products/items.
- The table connects customers' orders with products and sellers.
- Price and freight values may help analyze revenue and shipping costs.
- Shipping-related columns may support operational efficiency analysis.
