

05_payments

Table Purpose

This table contains payment-related information for customer orders, including payment methods, installment details, payment sequence, and payment values.

What One Row Represents

One row represents one payment transaction/record associated with a customer order.

Possible Primary Key

Composite key: (order_id + payment_sequential)

Reason: One order may contain multiple payment records or payment sequences.

Possible Foreign Keys

Column	Connected Table
order_id	orders

Columns Overview

Column	Business Meaning
order_id	Order associated with the payment
payment_sequential	Sequence number of payment record for an order
payment_type	Payment method used by the customer
payment_installments	Number of installments selected by customer
payment_value	Total payment amount for the order

Initial Observations

- The table helps analyze customer payment behavior and payment preferences.

- Installment information may help understand customer purchasing flexibility and affordability patterns.
- Payment methods may influence customer convenience and overall experience.
- Payment values can support revenue and transaction-related analysis.
- Some orders may contain multiple payment records, indicated by payment sequence values.
