

06_Dataset Documentation

Dataset Overview

The Olist Brazilian E-Commerce dataset contains real-world transactional data from a Brazilian e-commerce marketplace. The dataset includes information related to customers, orders, products, sellers, payments, reviews, delivery timelines, and geolocation data. The dataset follows a relational structure, making it suitable for data analytics, business intelligence, and relational analysis projects.

Dataset Tables Overview

Table Name	Business Meaning
customers	Customer information
orders	Order-level transaction details
order_items	Products included in each order
products	Product information and categories
sellers	Seller details
payments	Payment transaction details
reviews	Customer review information
geolocation	Geographic location data
product_category_name_translation	Translates product categories from Portuguese to English

Dataset Characteristics

- Relational e-commerce dataset
- Multi-table transactional structure
- Includes customer, product, payment, review, and operational data
- Suitable for customer, revenue, operational, and geographic analysis

Initial Dataset Familiarization

Before loading the dataset into Python and PostgreSQL, Excel was used for preliminary exploration and business understanding.

Activities performed:

- Reviewed table structures
- Examined column definitions
- Inspected sample records
- Identified business entities
- Understood relationships between tables
- Built familiarity with customer, order, payment, product, review, and seller data

Excel was used only for initial exploration. Detailed auditing, validation, and analysis were later performed using Python, PostgreSQL, and Power BI.
